

Milwaukee County EMS SYSTEM

INFORMATIONAL REPORT

EMS System Overview

Guiding Principles

[EMS 2050 Agenda
for the Future](#)

The Guiding Principles

EMS systems in 2050 will be designed around these six Guiding Principles to provide a framework for addressing the **most critical aspects** of developing a people-centered EMS system.

Terminology

- BLS – Basic Life Support
- ALS – Advanced Life Support
- EMT-B - Basic level trained provider
- Paramedic – ALS level trained provider, extensive training.

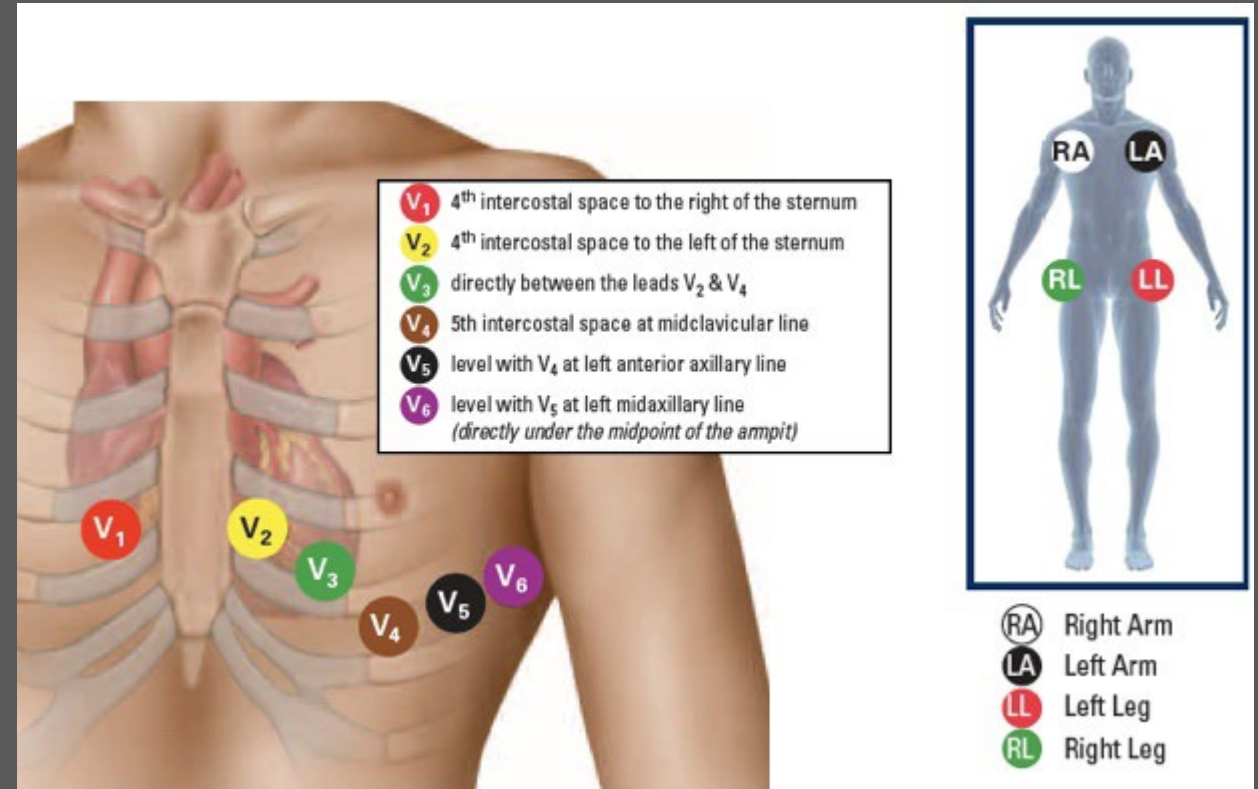

EMS System Stats

- 112,000 patient contact annually
- 76,800 transports annually
- 15 EMS agencies:
 - 9 ALS transport
 - 3 BLS Transport
 - 1 ALS non-transport
 - 2 BLS non-transport
- Milwaukee County subsidizes EMS with \$3.0M annually to improve healthcare operations.

EMS Division

- EMS Director's Office
 - EMS Education and Training
 - EMS Quality Assurance
 - EMS Data Analytics and Strategy
 - Special Operations
 - Medical Direction
 - EMS Research
 - EMS Council – Chapter 97

EVE Model

Evaluating Vulnerability and Equity - Updated Tuesday - Friday at 1:00 AM pending data availability

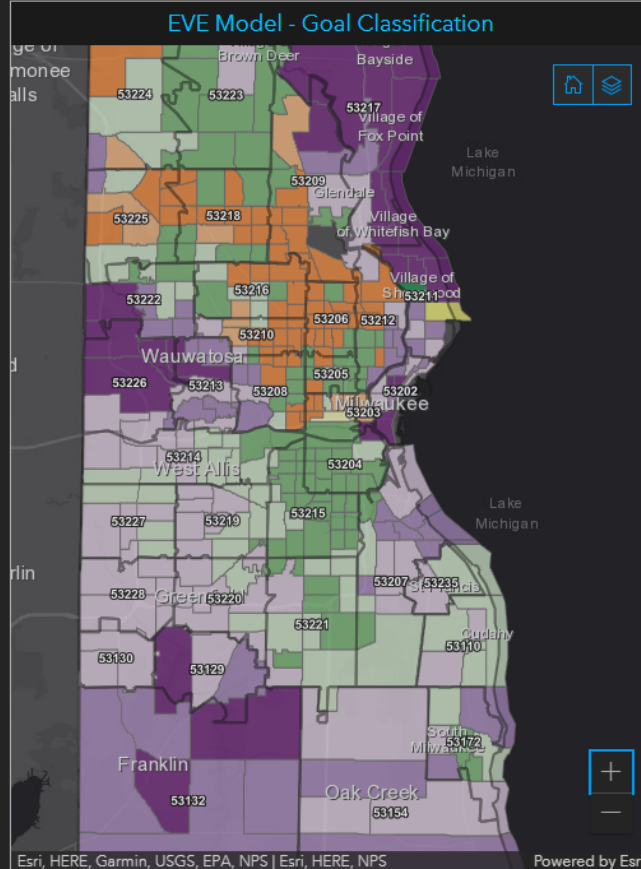

About the EVE Model

The COVID-19 pandemic highlighted systemic health inequities based on race and ethnicity. These tools are intended to enhance equity as we prioritize our most vulnerable residents for vaccine administration.

The EVE Model proposes that we view community vaccination rates alongside the [CDC Social Vulnerability Index \(SVI\)](#) to inform equitable allocation of this essential resource. Regularly mapping these results allows for targeted messaging and resource allocation in a dynamic, needs-focused manner. Furthermore, tracking vaccination rates based on SVI groupings provides an objective and transparent method of communicating progress.

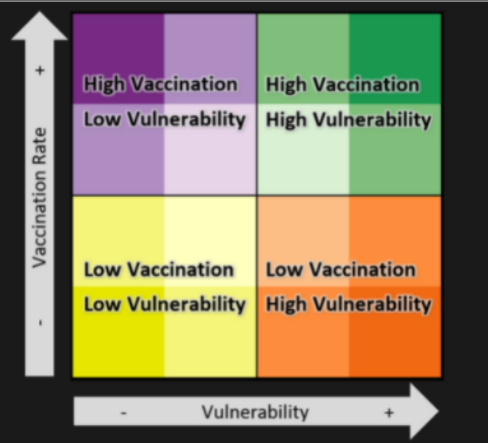

Two models for classifying vaccination rates were applied to census tracts in Milwaukee County, Wisconsin. SVI scores are generated every two years, so the classification of tracts by SVI remains static.

- Goal-Oriented Classification:** This classification was designed to monitor progress toward the goal of full vaccination for 80% of the county population aged 16 years and older. Census tracts were divided into four groups based on percentage of the population receiving at least one dose: **0-19%**, **20-49%**, **50-79%**, and **80-100%**. The color scheme of this map differs slightly from the diagram on this page, with any tract over 80% shown as **dark green** or **dark purple** to easily identify areas with goal achievement. Patients receiving at least one dose were used to populate these maps with the assumption that they will complete the vaccine series (those receiving the Johnson & Johnson vaccine need only receive one dose to complete the series).
- Outlier Classification:** This classification is better suited in

Key Points

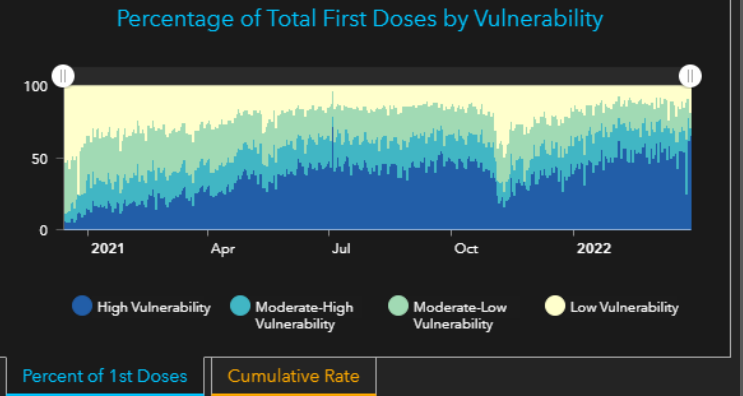

- This model was created to assist evaluation and guide vaccine deployment strategies. It is suggested that users focus efforts to shift the **orange** areas on the map to **green**, ensuring that the most vulnerable populations are addressed.
- Cut off values for vaccination rates may be dynamic based on real time community values or objective goals. SVI cut off values remain constant ranging from 0 being lowest to 1 being highest.
- Because this model is dynamic and changes each week based on the latest available data, it is recommended that users view the [Vaccination Rates by Vulnerability](#) graphs to evaluate the effect of strategies on the four SVI groups over time. The graphs can be found to the right of this text.
- All rate data associated with census numbers will be transitioned over to the 2020 census results once the full data set becomes available.

Major Accomplishments Vaccine Clinic

- More than 17,000 doses of vaccine administered
- 2nd largest community site
- More than 450 in home vaccines
- Exclusively staffed by EMS providers
- Exposed nearly 10,000 people to hands only CPR training in observation area
